DATE MAILED: 06/18/2004

Please find below and/or attached an Office communication concerning this application or proceeding.

## Office Action Summary

Application No.

10/039,461

Applicant(s)

ROSE ET AL.

Examiner

Marceau Milord

Art Unit

2682

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

### Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

### Status

- 1) ☒ Responsive to communication(s) filed on 28 December 2001.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

### Disposition of Claims

- 4) ☒ Claim(s) 1-20 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☐ Claim(s) 1-20 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

### Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 08 July 2002 is/are: a) ☐ accepted or b) ☒ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

### Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
  - ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

## DETAILED ACTION

### Claim Rejections - 35 USC § 103

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. Claims 1-20 are rejected under 35 U.S.C. 103(a) as being unpatentable over Irwin (US Patent No 6658264 B1) in view of Hayes et al (US Patent No 6204819 B1).

Regarding claims 1-2, Irwin discloses a portable communication device (figs. 1-3) comprising: a first transceiver (210 of fig. 2 or 372 of fig. 3); a second transceiver (220 of fig. 2 or 344 of fig. 3; col. 4, line 18-col. 5, line 29); and a switch (324 of fig. 3) to couple the first transceiver to an antennae (col. 2, line 45- col. 3, line 11; col. 6, lines 3- 38).

However, Irwin does not specifically disclose the features of a first micro-electromechanical system switch; and a second MEMS switch to couple the second transceiver to the antennae.

On the other hand, Hayes et al, from the same field of endeavor, discloses a multiple frequency band antennas having first and second conductive branches that are provided for use

Art Unit: 2682

within wireless communications devices such as radiotelephones. The first micro-electrical switch is configured to selectively connect the first feed to either ground or to a receiver and/or transmitter that receives and/or transmits wireless communication signals. The second micro-electrical switch is configured to selectively connect the second feed to different receiver/transmitter (col. 2, line 21- col. 3, line 8; col. 4, lines 41- 67; col. 7, lines 30- 52). In addition, the first and second switches are micro-electrical systems switches (col. 5, line 12-col. 6, line 33). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to apply the technique of Hayes to the communication system of Irwin in order to provide compact antennas that can radiate within multiple frequency bands for use within wireless communications devices.

Regarding claim 3, Irwin as modified discloses a portable communication device (figs. 1-3) comprising: a first transceiver (210 of fig. 2 or 372 of fig. 3); a second transceiver (220 of fig. 2 or 344 of fig. 3; col. 4, line 18-col. 5, line 29), wherein the first transceiver and the second transceiver are adapted to communicate at about 1.9 GHz, 1.8 GHz, or 900 MHz (col. 4, lines 38- 54; col. 6, lines 8- 38).

Regarding claims 4-9, Irwin as applied to claim 1 above differs from claims 4-9 in the present invention, in that Irwin fails to disclose the first MEMS switch includes a cantilever adapted to move to a first position to couple the antennae to the first transceiver, wherein the cantilever of the first MEMS switch is adapted to move to a second position to disconnect the antennae from the first transceiver, wherein the first MEMS switch has an input node directly connected to the antennae, wherein the field effect transistor switch and the first MEMS switch are contained within the same semiconductor substrate.

However, Hayes discloses a multiple frequency band antennas having first and second conductive branches that are provided for use within wireless communications devices such as radiotelephones. The first micro-electrical switch is configured to selectively connect the first feed to either ground or to a receiver and/or transmitter that receives and/or transmits wireless communication signals. The second micro-electrical switch is configured to selectively connect the second feed to different receiver/transmitter (col. 2, line 21- col. 3, line 8; col. 4, lines 41- 67; col. 7, lines 30- 52). In addition, the first and second switches are micro-electrical systems switches (col. 5, line 12-col. 6, line 33). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to apply the technique of Hayes to the communication system of Irwin in order to provide compact antennas that can radiate within multiple frequency bands for use within wireless communications devices.

Regarding claim 10, Irwin discloses a portable communication device (figs. 1-3) comprising: an antennae; a first switch (324 of fig. 3) that is enabled with an electrical signal; a first transceiver (210 of fig. 2 or 372 of fig. 3); wherein the switch (324 of fig. 3) is adapted to coupled the first transceiver to the antennae; and a second transceiver (220 of fig. 2 or 344 of fig. 3), wherein the switch is adapted to coupled the second transceiver to the antennae (220 of fig. 2 or 344 of fig. 3; col. 4, line 18-col. 5, line 29)(col. 2, line 45- col. 3, line 11; col. 6, lines 3- 38)..

However, Irwin does not specifically disclose the features of a first mechanical switch; and a second mechanical switch to couple the second transceiver to the antennae, wherein the second mechanical switch that is enabled with an electrical signal.

On the other hand, Hayes et al, from the same field of endeavor, discloses a multiple frequency band antennas having first and second conductive branches that are provided for use

Art Unit: 2682

within wireless communications devices such as radiotelephones. The first micro-electrical switch is configured to selectively connect the first feed to either ground or to a receiver and/or transmitter that receives and/or transmits wireless communication signals. The second micro-electrical switch is configured to selectively connect the second feed to different receiver/transmitter (col. 2, line 21- col. 3, line 8; col. 4, lines 41- 67; col. 7, lines 30- 52). In addition, the first and second switches are micro-electrical systems switches (col. 5, line 12-col. 6, line 33). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to apply the technique of Hayes to the communication system of Irwin in order to provide compact antennas that can radiate within multiple frequency bands for use within wireless communications devices.

Regarding claims 12-15, Irwin as applied to claim 10 above differs from claims 12-15 in the present invention, in that Irwin fails to disclose a first field effect transistor switch coupled to the first mechanical switch, wherein the first field effect transistor switch and the first mechanical switch are both formed in the same semiconductor substrate, a second base band module adapted to process signals at a second frequency, the second base band module coupled to the antennae when the second mechanical switch is enabled.

However, Hayes discloses a multiple frequency band antennas having first and second conductive branches that are provided for use within wireless communications devices such as radiotelephones. The first micro-electrical switch is configured to selectively connect the first feed to either ground or to a receiver and/or transmitter that receives and/or transmits wireless communication signals. The second micro-electrical switch is configured to selectively connect the second feed to different receiver/transmitter (col. 2, line 21- col. 3, line 8; col. 4, lines 41- 67;

Art Unit: 2682

col. 7, lines 30- 52). In addition, the first and second switches are micro-electrical systems switches (col. 5, line 12-col. 6, line 33). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to apply the technique of Hayes to the communication system of Irwin in order to provide compact antennas that can radiate within multiple frequency bands for use within wireless communications devices.

Regarding claim 16, Irwin as modified discloses a portable communication device (figs. 1-3), wherein the first frequency is at least twice the second frequency (col. 5, line 7- col. 6, line 47).

Regarding claim 17, Irwin as modified discloses a portable communication device (figs. 1-3), wherein the first frequency is about 1 .9 GHz (col. 4, lines 38- 54; col. 6, lines 8- 38).

Regarding claims 18-20, Irwin discloses a method of performing a wireless communication (figs. 1-3), comprising: coupling a first transceiver (210 of fig. 2 or 372 of fig. 3) to an antennae with a first electrically enabled switch (324 of fig. 3); and de-coupling a second transceiver (220 of fig. 2 or 344 of fig. 3; col. 4, line 18-col. 5, line 29) from the antennae; and transmitting with the second transceiver at a second frequency, the second frequency being lower than the first frequency (col. 2, line 45- col. 3, line 11; col. 6, lines 3- 38).

However, Irwin does not specifically disclose the features of a second electrically enabled mechanical switch coupling the second transceiver to the antennae with the second electrically enable mechanical switch

On the other hand, Hayes et al, from the same field of endeavor, discloses a multiple frequency band antennas having first and second conductive branches that are provided for use within wireless communications devices such as radiotelephones. The first micro-electrical

Art Unit: 2682

switch is configured to selectively connect the first feed to either ground or to a receiver and/or transmitter that receives and/or transmits wireless communication signals. The second micro-electrical switch is configured to selectively connect the second feed to different receiver/transmitter (col. 2, line 21- col. 3, line 8; col. 4, lines 41- 67; col. 7, lines 30- 52). In addition, the first and second switches are micro-electrical systems switches (col. 5, line 12-col. 6, line 33). Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to apply the technique of Hayes to the communication system of Irwin in order to provide compact antennas that can radiate within multiple frequency bands for use within wireless communications devices.

### Conclusion

3. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Palamara US Patent No 6654362 B1 discloses a method and apparatus that uses the location of a mobile terminal to direct the mobile terminal to a candidate receiver for participation in a handoff of the mobile terminal.

Johnson et al US Patent No 6714800 B2 discloses a wireless cellular communication system in which groups of cellular base stations communicate with a central office via a narrow-band millimeter wave trunk line.

Silverbrook et al US Patent No 6741871 B1 discloses a mobile telephone that may act as a base station for a machine readable code sensor pen to enable connection of the pen with a computer system.
